SHEEP AND WOOL.

xtensively pursued in the United States, does not keep pace with the manufactur ing demand, or anywhere near the wants of a population of nearly fifty millions of people, which depends largely upon foreign supplies of manufactured goods, despite a high tariff. We may roughly estimate the wool production of the United States at the present time at 200,000,000

Although the business of wool-growing

Although the business of wool-growing has increased very rapidly in late years in the United States, it is doubtful, with a rapidly increasing population, and with a lall the protection of tariff, and opportunities of profitable returns, if the business will keep pace with the demand. We have noticed within the past four years a notable diminution in the quantity of wool grown in the Middle States, and a large increase from the Western regions, particularly in California, which now supplies nearly one-third of the total product of the country.

While Texas with its immense area has steadily increased in its supply, it has not from the attention given there to cattle raising and cotton growing, made the advance in wool growing equal to the general expectation, or comparatively as favorable as the increase witnessed in the more northerly region of Colorado, and it may be doubted, if the southern part of the United States can successfully compete with the middle or northern parts in quantity while it certainly connot in quality in entirety.

WOOL GROWING IN CALIFORNIA.

limit of between 600 and 700 miles, and while we accept a marked distinction in that State of superiority of the extreme northern, over the southern, we may assume that for profitable returns the central point of the State offers the most inducement. This arises from the economy of management, where the winters are mild, and where the summers are not too oppressive, where no artificial feed is necessary in winter and where sheep can subsist without shelter.

pressive, where no artificial feed is necessary in winter and where sheep can subsist without shelter.

While the Eastern and Central farmers may continue a profitable growing of wool in connection with other business, it is evident that we cannot expect from them any considerable increase, and that we must look to regions further west to supply our constantly increasing demand.

We may look for the region north and south of and along the thirty-fifth parallel from Western Kansas to California, through the territories of New Mexico and Arizons, as the region at the present time offering an extensive field for the prosecution of the wool growing business, and peculiarly adapted to it, particularly in New Mexico, at the present time, when the railway system being completed has entirely changed the system before existing, and when the great difficulties arising from the want of transportation and Indian visitations are forever removed.

Here an area twice as large as the New Enoland States, laid open to the ore

dian visitations are forever removed.

Here an area twice as large as the
New England States, laid open to the enterprise of the wool grower, is capable of
supplying an amount equal to one half of
the present yield of the United States. No portion of the Union has a climate

this respect, the territory, when it is merits are known, will rank beyond the average of Colorado or California.

The territory, as a whole, does not present to the Eastern visitor the agricultural aspect of the Atlantic or Middle States, and in reality lass put a comparatively limited area applicable for cultivation without irrigation and has a long annual season of drought. Nor will the average produc of the land in food for sheep equal that, or in any way compare with the Eastern States.

This condition is also applicable to California and Australia and other successful wool bearing regions; nor will the grazing lands of the territory excepting in highly favored districts ever see a holding in value, equal to that of lands in Kansas and lows, but for wool growing lands, will have a value commensurate with the market value of the product given.

PROMABLE PROVITS.

valuation of \$5 per acre, and upon a better class of land, not valuable under existing condition for cultivation, of six per listing condition for cultivation for the listing condition for cultivation for such samples of listing conditions for cultivation for the listing condition for cultivation for the list

a good flock is five pounds of wool per annum, and that its average market price, freight and commission paid, is twenty-four cents per pound, this will give \$120, or 6 per cant on \$20. Under ordinary circumstances the surplus multon should pay wholly for the care of sheep.

We may therefore arrive at an approximation of the value of grazing land for sheep, and perceive that land which is so poor as to have sight agras of it required to carry one sheep, may pay a fair incomenon a valuation of \$2.50 per acre. Upon this basis a tract of 40 acres or the size of Boston Common would have a capacity of five sheep, and a valuation of \$100.

The average attitude of the whole of the territory of New Mexico in short 5,600 feet above the level of the ses, or relatively nearly as high as the top of Mount Washingtod. This seogras an exemption from the fogs and vapors of low regions, and gives an air of great purity, and one does not feel there the rarefacation experionsed generally at high allitudes.

It is a well known fact that sheep do better in large flocks at high allitudes.

It is a well known fact that sheep do better in large flocks at high allitudes.

It is a well known fact that sheep do better in large flocks at high allitudes.

It is a well known fact that sheep do better in large flocks at high allitudes.

It is a well known fact that sheep do better in large flocks at high allitudes.

It is a well known fact that sheep do better in large flocks at high allitudes.

It is a well known fact that sheep do better in large flocks at high allitudes.

The principal grass of the country is the mountainous regions of Asia, and the high table lands of South America and Contral Australia, and although they thrive below sea level, as witnessed in Holland, they are subject to balling and floot rot, and an aggravated scab disease from which they are exempt in high, dry regions.

The principal grass of the country is

The principal grass of the country is known as the gramma, which grows universally upon the mesa or table lands of New Mexico, and as the Alfaliera or native clover of California and the Alfalia of South America is wonderfully nutritious in quality, and will probably make more meat than any other native grass.

The rainy secson, commencing generally

meat than any other native grains.

The rainy segson, commencing generally,
in July, starts the gramma grass throughout the region, which retains its vitality,
and has a slow growth during the winter,
and when it does die, curse standing as a
first-class hav. first-class hay.

The sheep of New Mexico at the present time, with the exception of those ent time, with the exception of those lately introduced, are of the Churro breed, lineally descended from the same breed now existing in old Spain, brought over by the Spaniards soon after the conquest, and similar to those found generally in Mexico and South America, and in New Mexico are of a pure strain which have been bred in, for three centuries, and are hardy and gregarious, and admitrably adapted to the country, and to breed from with the pure blooded Spanish merino.

The aheep are small, and though most accellent for mutton, give four or five pounds of coarse hairy wooh, fit only for heavy; receipts 17,000 bushels; shipments 1,500 bards; and of the country of the c

carpets and ordinary goods, but a single cross from the pure blooded merino gives a wonderful improvement, and in two or three generations gives a wool equal to the average Ohio, and worth in the market fully double the present product, which goes principally to Philadelphia.

It would be advisable to breed from the present stock, which is acclimated and accustomed to the range, rather than to carry in new sheep, excepting for cross breeding, and it would be better to cross with the pure blooded Spaniah merino, than the Cotswold, owing to the disparity in size.

in size.

It may be estimated that a flock of ewes with ordinary management will give an annual income of eighty per cent, and as the ewe lambs bear the second year, one may estimate an increase of one thousand per cent from a flock of ewes in six years, and it will soon become in New Mexico as in California at the present time, a question of land rather than sheep, for the latter increase so rapidly as to diminish in walue while land rapidly appreciates.

PACTS TO CONSIDER. FACTS TO CONSIDER.

There are many things to consider in the wool growing business anywhere, and particularly in New Mexico, where the particularly in New Mexico, where the country is so open and new to settlement. Great care should be given in selecting a range where water from springs or wells can be obtained, and the wool grower's first business should be to become thoroughly acquainted with his range, and after engaging, always have an exact knowledge of the locality where his sheep can be found, and adept a system in doing business and should exercise the greatest care in breeding, and docking and branding.

Particular attention should be given

Particular attention should be given against overstocking, in treating against the scab disease, and guarding against loss by theit and atraying.

There is a vast deal more of work in wool growing when properly attended to than in cattle raising, and a proportionate increase of profits. Many undertake it who throw up the business in disgust, while their neighbors grow rich.

Experience and determination are as essential as capital, and it would be better to have the first with credit and start in debt, than with capital without a knowledge of the business, and a determination to persevere in it.

Financial and Commercial.

to persevere in it.

senet to the Eastern visitor the agricultural sapect of the Atlantic or Middle States, and in reality has put a comparatively limited area applicable for cutivation with out irrigation and has a long annual season of drought. Nor will the average produce of the hand in food for sheep equal that, or in any way compare with the Eastern States.

This condition is also applicable to Callfornia and Australia and other successful wool bearing regione; nor will the grazing lands of the territory excepting in highly favored districts ever see a holding in value, equal to that of lands in Kansas and Jowa, but for wool growing lands, will have a value commensurate with the market value of the product given.

PROBABLE PROFITS*

It may be safely assumed that ordinary grazing lands in California will pay size per cent interest for wool growing upon a valuation of \$5 per acre, and upon a better class of land, not valuable under existing condition for cultivation, of six per late the class of land, not valuable under existing condition for cultivation, of six per late the class of land, not valuable under existing condition for cultivation, of six per late the class of land, not valuable under existing condition for cultivation, of six per late the class of land, not valuable under existing condition for cultivation, of six per late the class of land, not valuable under existing condition for cultivation, of six per late the class of land, not valuable under existing condition for cultivation, of six per late the class of land, not valuable under existing condition for cultivation, of six per late the class of land, not valuable under existing condition for cultivation, of six per late the class of land, not valuable under existing condition for cultivation, of six per late the class of land, not valuable under existing condition for cultivation, of six per late the class of late Spocks-The market opened stong and ad-

S712,300 in French coin.

The Treasury, up to noon to-day, had been able to get only \$32,000 & of 1880, at 1023.

The meney market continues stringent while 6 per cent is the rate at bank. Borrowers on stock collateral are paying at the Stock fax-change, commissions ranging from 1-33 to 14 of 1 per cent per day to get money at the bank rate, long time loans, maturing after January 15th, by which time the money market should be easy, are to be had at from 6 to 4 per cent, but loans up to that time cost a heavy commission.

The Bulletin says: Nothwithstanding tha hopes of yesterday that the "money squeeze"

The Bulletin says: Nothwithstanding the hopes of yesterday that the "money squeeze" had culminated there has been no day when borrowers have paid higher rates than to-day, nor when there has been greater difficulty in getting loans. A very large part of all the money borrowed on stocks to-day cost a commission, and yet with this money market the rates for bills on London were advanced 'X cent for sixty flays and a full cent for short date remittances. It looks as if the limit of utilizing London capital to support New York speculation was not far off, as we know that several influential bankers to-day got word from London that anything like a continuance of the present movement of gold from Lon-don here would be met byla decisive action on the part of the Bank of England. Transactions 382,000 shares, om London that anything like a c
